```
function [ y ] = myDFTConv(x, h)
3 %transfer over to frequency domain
  l = size(x,2) + size(h,2) - 1;
  x_w = fft(x, 1);
  h_{-w} = fft(h, l);
  \% element \ multiplication \ to \ get \ y\_w
  y_{-}w = x_{-}w.*h_{-}w;
11 %return to discrete domain
  y = ifft(y_w);
  %plot my result
15 figure;
  subplot (211);
stem(y);
title('myDFTConv');
19
  %plot key
21 subplot (212);
  stem(conv(x,h));
23 title ('conv(x,h)');
  end
```

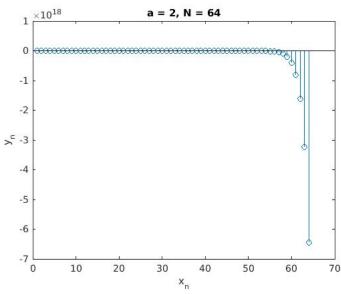

myDFTConv.m

Because of the use of fft and ifft, the time coplexity is also O(Nlog(N)).

```
_{1} function [y_{n}] = sys1(a,N)
3 %get delta function
  x_n = zeros(1,N);
_{5}|_{\mathbf{x}_{-}\mathbf{n}(1)}=1;
7 %get shifted delta function
   x_n_1 = zeros(1,N);
9 \mid x_n_1(2) = 1;
y_n = zeros(1,N+1);
_{13} for i = 1:N,
       y_n(i+1) = a.*y_n(i) + 0.3.*x_n(i) -2.*x_n_1(i);
  end
  y_n = y_n(2:length(y_n)); % remove first element to get to N
  figure;
  stem(y_n);
19 title ('a = 2, N = 64');
ylabel('y_n');
21 xlabel('x_n');
  end
```

sys1.m

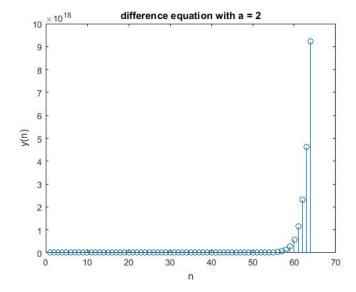

Notice that this function is in the order of $-e^x$ therefore, it is not stable $\lim_{x_n\to\infty} y_n = -\infty$. The system is causal, however, by the finite difference equation, output only depends on past or current inputs.

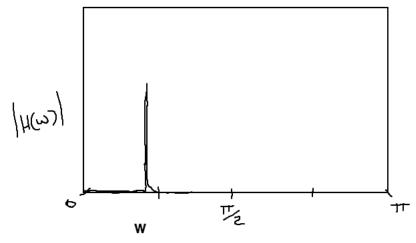

```
function [ y-n ] = sys2( x-n, a )
N = 64; % length always 64
y-n = zeros(1,N+1);

for i = 1:64,
    y-n(i+1) = a*y-n(i) + x-n(i).^2;
end
y-n = y-n(2:length(y-n)); % remove first element to shorten to 64

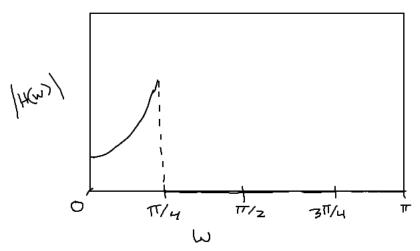

figure;
stem(y-n);
title('difference equation with a = 2');
xlabel('n');
ylabel('y(n)');
end
```

sys2.m

We can see on the interval from $\omega = 0to\pi$, that there is only one point where the magnitude is not zero. Therefore, there is a spike at that point.

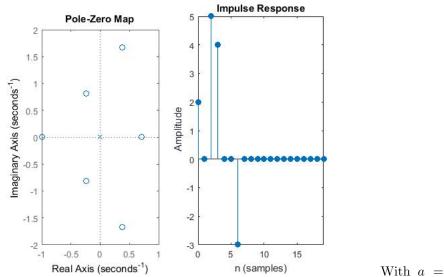

We can see on the interval from $\omega=0to\pi$ that there is a minimum at $\omega=0$ and a maximum at $\omega=\pi/4$ so the graph is increasing until that point.

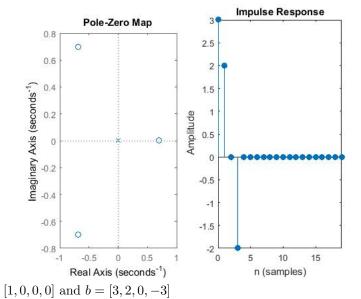

```
function [ ] = pzplot_impz( a,b )
S = tf(b,a);
N = 20;

figure;
subplot(121);
pzplot(S);
subplot(122);
impz(b,a,N);
end
```

 $pzplot_impz.m$

[1,0,0,0,0,0,0] and b=[2,0,5,4,0,0,-3] There are no poles on the unit circle so the system is most likely stable.

With a =

With a =

$$\begin{split} H(z) &= z/(z + e^{-i8\pi/10})(z + ^{i8\pi/10}) \\ &= z/z(z + e^{-i8\pi/10} + e^{i8\pi/10}) \\ &= 1/(z + 2\cos(4\pi/5)) \\ &= (z^{-1})/(1 + z^{-1}2\cos(4\pi/5)) \\ a &= [1, 2\cos(4\pi/5)], b = [0, 1] \end{split}$$
