waveletdenoise.m

Report Item 2 The father wavelet is called a corking function because it fills up the holes of the lower frequency components that the mother wavelets do not detect. The wavelet coeffiecients are different than fourier coefficients because in wavelet analysis, a short modulated window is used to complete the spectral representation for that chunk. After that, the window is shifted along the signal. It is a time-frequency analysis instead a purely frequency analysis.

Report Item 3

```matlab
